QL2 announces Web mining solutions
Four new Application Service Provider (ASP) applications

SEATTLE, Wash., March 1, 2004 – QL2 Software today announced four Web mining solutions – cyberPrice, ctWatch, siteWatch, and newsWatch – all delivered on-line from the QL2 Client Center.

cyberPrice shops for competitive prices from on-line catalogs and e-commerce sites and delivers reports for actionable decision making and analytical processing.

ctWatch reports on user specified treatments and drugs from Web sites containing clinical trial information.

siteWatch monitors changes in designated Web sites with page archiving and automatic change alerting.

newsWatch provides a tightly focused, high performance method of monitoring Internet news sources.

All of these solutions are built with QL2's award winning Web mining software tool, WebQL. They are delivered to customers via the QL2 Client Center, a secure Web site. To get started all a customer needs is an Internet connected PC and a browser. There is no hardware to buy or software to install.

"We have been delivering Web mining solutions to customers since our inception in April, 2000" noted Chris Buckingham, president of QL2 Software. "Some of these were delivered repeatedly so we decided to brand them and deliver them in a convenient way. The application service provider (ASP) model proved to be the perfect vehicle."

These solutions are available immediately with prices starting at \$7,000 per year. For more information, log on to www.QL2.com. Free evaluations are available to qualified prospects. Interested parties should contact QL2 at +1.206.443.6836 or sales@QL2.com

About QL2

Founded in April, 2000, QL2 Software has become a leading provider Web mining and unstructured data management tools and solutions. Its customers are among the largest in the travel, life sciences, energy, distribution, and high tech manufacturing industries.
